RE: Soil Evaluation Summary
4673 Kiser Island Rd. Catawba County
BOSS Project #: 2806

On June 20, 2024, a soil evaluation on a 0.60-acre parcel at 4673 Kiser Island Rd. in Terrell, NC in Catawba County described as PIN 461602563263.

Methods

Borings were advanced to observe and document the soil properties. Field tests were conducted on samples to determine texture and consistence using the Department of Agriculture, Natural Resource Conservation Service, National Soil Survey Center Guide for Describing and Sampling Soils.

Three borings(B1-B3) were evaluated on the parcel. Please see Table below for soil properties. Please see the attached map for pit locations.

Findings

Boring #	Depth (inches)	Soil Property
B1	35	Acceptable depth, structure, mineralogy and no indications of wetness. Saprolite was encountered at 35 inches.
B2	48	Acceptable depth, structure, mineralogy and no indications of wetness
B3	38	Acceptable depth, structure, mineralogy and no indications of wetness. Saprolite was encountered at 38 inches.

Discussion

The following criteria must be evaluated and found suitable for approval of an onsite wastewater disposal system:

- A minimum depth to rock, wetness, or other limiting layer (varies with system type)
- Clay mineralogy, soil structure and consistency
- Undisturbed soil
- Topography and landscape position
- Setbacks from: surface waters (lakes, ponds, creeks, etc.), wells, structures, and property lines
- After all the above criteria are met there must be enough remaining space for a system

The purpose of the onsite wastewater septic system is to serve as a mechanism to treat and dispose of wastewater generated from a facility, in this case a residence. Wastewater leaves the house and enters a septic tank that serves to clarify and microbially treat the waste. The wastewater then goes to a distribution device and out to the field lines where it is slowly applied to nitrification trenches and percolates into the soil, naturally removing harmful coliform bacteria, viruses, and nutrients.

The area of the parcel that was evaluated was found to be suitable for onsite wastewater disposal. A layout would also need to be done to definitively determine how many bedrooms or additional bedrooms can be accommodated by this lot.

If you have any questions regarding the evaluation, please contact Benfield Outdoor Services and Solutions.
